Note: Measure is the percentage of patients ages 18-85 years who had a diagnosis of hypertension and whose blood pressure was adequately controlled (less than 140/90 mmHg) during the measurement period.

From 2016 to 2018, average hypertension control across all HRSA-funded health centers met or exceeded the Healthy People 2020 target. In 2018, 1 of every 25 health centers met or exceeded the [Million Hearts](#) target for hypertension control. However, racial and ethnic disparities still persist among patients treated in health centers. For more information, go to AHRQ's [Data Spotlight](#) and [Data Query Tool](#). The most recent data on the Health Center Program can be accessed online at HRSA's [Health Center Program web pages](#).
