AHRQ’s EvidenceNOW: Helping Small Primary Care Practices Build Capacity for Quality Improvement

One of the main goals of EvidenceNOW is increasing the capacity of primary care practices to implement evidence into practice. We define capacity as the attitudes, skills, structures, and processes that enable a primary care practice to improve systematically. For example, practices with capacity for quality improvement are eager to learn from mistakes, create and train high-functioning teams, and integrate improvements into their work.

At baseline, most EvidenceNOW practices already had some capacity to implement new evidence into practice but had room for growth.

EvidenceNOW is providing customized support to primary care practices to help them improve the delivery of the ABCS of heart health and increase their capacity for quality improvement. Local and national evaluations will explore whether EvidenceNOW was able to achieve both goals.
